WATER FACTSHEET

This factsheet will provide you with helpful tips and links to websites to help you encourage and ensure your child is drinking enough water..

TOP TIPS ABOUT WATER:

Water is one of the most natural, healthy beverages that children can drink. By encouraging your child to drink 6-8 glasses of water every day this will increase their chances of becoming a healthy adult and improve health problems such as continence and poor concentration.

Current research suggests that approximately 30- 50 % of children under 11years old drink less than the recommended daily value.

Tip 1: Repeated tastings will help your child develop a taste for water. Ask your child to drink a small amount of water before they have their juice or milk.

Tip 2: Always give your child a drink with breakfast

Tip 3: Ensure your child has access to water at school and that teachers and guardians encourage regular drinking. Always have water available for trips and outings.

Tip 4: Let your child choose their own drinks container or cup

Tip 5: Make it fun; use straws or shaped ice cubes

Tip 6: Set small targets: put markers/targets on the drink container for your child to aim for during the day

Tip 7: Substitute drinks with ice lollies, jelly and yoghurts.
Remember most fruit and vegetables have high water content.

Tip 8: Encourage extra fluid when playing sports or when exposed to warm weather as unlike adult's children do not always recognise the early stages of thirst
